Application No.: 10/802,591

IN THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Currently Amended) A method of detecting arc discharge in a glow-discharge apparatus that has a high-frequency power source, in which a cutting pulse is output for a time T1 to the high-frequency power source to stop a supply of power to the glow-discharge apparatus, when $dV_r/dt - dV_f/dt$ increases over a first level, where V_f and V_r are a traveling-wave voltage and a reflected-wave voltage applied to the glow-discharge apparatus, respectively; and arc discharge is determined to have developed in the glow-discharge apparatus, when V_r/V_f increases to a second level or a higher level within a preset time T_o during which the supply of power is re-started after the supply of power to the glow-discharge apparatus is stopped during the time T1.

2. (Currently Amended) A method of detecting arc discharge in a glow-discharge apparatus that has a high-frequency power source, in which a cutting pulse is output for a time T1 to the high-frequency power source to stop a supply of power to

the glow-discharge apparatus, when $dV_r/dt-dV_f/dt$ increases over a first level, where V_f and V_r are a traveling-wave voltage and a reflected-wave voltage applied to the glow-discharge apparatus, respectively; arc discharge is determined to have developed in the glow-discharge apparatus, when V_r/V_f increases to a second level or a higher level within a preset time T_0 during which the supply of power is re-started after the supply of power to the glow-discharge apparatus is stopped; during the time T_1 ; and the supply of power to the glow-discharge apparatus is further stopped for time T_1 after the arc discharge is detected again during the preset time T_0 .

3. (Withdrawn) A method of detecting arc discharge in a glow-discharge apparatus that has a high-frequency power source, in which a cutting pulse is output for time T_1 to the high-frequency power source to stop a supply of power to the glow-discharge apparatus, when $dV_r/dt-dV_f/dt$ increases over a first level, where V_f and V_r are a traveling-wave voltage and a reflected-wave voltage applied to the glow-discharge apparatus, respectively; and arc discharge is determined to have developed in the glow-discharge apparatus, when V_r/V_f increases to a second level or a higher level and V_f becomes greater than $V_{fmax} \times 0.05$ within a preset time T_0 after the supply of power to the glow-discharge apparatus is stopped.

4. (Withdrawn) A method of detecting arc discharge in a glow-discharge apparatus that has a high-frequency power source, in which a cutting pulse is output for time T1 to the high-frequency power source to stop a supply of power to the glow-discharge apparatus, when $dV_r/dt - dV_f/dt$ increases over a first level, where V_f and V_r are a traveling-wave voltage and a reflected-wave voltage applied to the glow-discharge apparatus, respectively; arc discharge is determined to have developed in the glow-discharge apparatus, when V_r/V_f increases to a second level or a higher level and V_f becomes greater than $V_{fmax} \times 0.05$ within a preset time T_o after the supply of power to the glow-discharge apparatus is stopped; and the supply of power to the glow-discharge apparatus is further stopped for time T1 after the arc discharge is detected.

5. (Withdrawn) The method of detecting arc discharge, according to any one of claims 1 to 4, wherein the first level ranges from $V_{fmax} \times 0.05$ to $V_{fmax} \times 0.2$, the second level ranges from 0.5 to 0.95.

6. (Currently Amended) The method of detecting arc discharge, according to any one of claims 1 [[to 4]] or 2, wherein the arc discharge is determined to have

developed when V_r/V_f remains at the second level or a higher level for time T_2 or longer.

7. (Original) The method of detecting arc discharge, according to claim 6, wherein the first level ranges from $V_{fmax} \times 0.05$ to $V_{fmax} \times 0.2$, and the second level ranges from 0.5 to 0.95.

8. (Currently Amended) The method of detecting arc discharge, according to claims 1 [[to 4]] or 2, wherein the preset time T_0 is measured, starting at a trailing edge of the cutting pulse.

9. (Original) The method of detecting arc discharge, according to claim 6, wherein the preset time T_0 is measured, starting at a trailing edge of the cutting pulse.

10. (Withdrawn) A method of detecting arc discharge in a glow-discharge apparatus that has a high-frequency power source, in which a load to the glow-discharge apparatus is determined to undergo impedance matching, when V_r/V_f is at a third level or a lower level, where V_f and V_r are a traveling-wave voltage and a reflected-wave voltage applied to the glow-discharge apparatus, respectively; and

arc discharge is determined to have developed in the glow-discharge apparatus, when V_r/V_f thereafter increases to a second level or a higher level.

11. (Withdrawn) A method of detecting arc discharge in a glow-discharge apparatus that has a high-frequency power source, in which a load to the glow-discharge apparatus is determined to undergo impedance matching, when V_r/V_f is at a third level or a lower level, where V_f and V_r are a traveling-wave voltage and a reflected-wave voltage applied to the glow-discharge apparatus, respectively; arc discharge is determined to have developed in the glow-discharge apparatus, when V_r/V_f thereafter increases to a second level or a higher level; and a supply of power to the high-frequency power source is stopped for time T_1 after the arc discharge is detected.

12. (Withdrawn) A method of detecting arc discharge in a glow-discharge apparatus that has a high-frequency power source, in which a load to the glow-discharge apparatus is determined to undergo impedance matching, when V_r/V_f is at a third level or a lower level, where V_f and V_r are a traveling-wave voltage and a reflected-wave voltage applied to the glow-discharge apparatus, respectively; and arc discharge is determined to have developed in the glow-discharge apparatus,

when V_r/V_f thereafter increases to a second level or a higher level and V_f is greater than $V_{fmax} \times 0.05$.

13. (Withdrawn) A method of detecting arc discharge in a glow-discharge apparatus that has a high-frequency power source, in which a load to the glow-discharge apparatus is determined to undergo impedance matching, when V_r/V_f is at a third level or a lower level, where V_f and V_r are a traveling-wave voltage and a reflected-wave voltage applied to the glow-discharge apparatus, respectively; arc discharge is determined to have developed in the glow-discharge apparatus, when V_r/V_f thereafter increases to a second level or a higher level and V_f is greater than $V_{fmax} \times 0.05$; and a supply of power to the high-frequency power source is stopped for time T_1 after the arc discharge is detected.

14. (Withdrawn) The method of detecting arc discharge, according to any one of claims 10 to 13, wherein the second level ranges from 0.5 to 0.95, and the third level ranges from 0.05 to 0.5.

15. (Currently Amended) A high-frequency arc-discharge control apparatus comprising: a glow-discharge apparatus which receives power from a high-frequency

power source through a power meter and an impedance-matching circuit; a first cutting-pulse output unit which outputs a cutting pulse for a time T_1 to the high-frequency power source when $dV_r/dt-dV_f/dt$ increases over a first level, where V_f and V_r are a traveling-wave voltage and a reflected-wave voltage applied from the power meter, respectively; and a second cutting-pulse output unit which outputs the cutting pulse again for time T_1 to the high-frequency power source when V_r/V_f increases over a second level within a preset time T_0 during which the supply of power is re-started after the first cutting-pulse output unit outputs a cutting pulse during the time T_1 .

16. (Currently Amended) A high-frequency arc-discharge control apparatus comprising: a glow-discharge apparatus which receives power from a high-frequency power source through a power meter and an impedance-matching circuit; a first cutting-pulse output unit which outputs a cutting pulse for a time T_1 to the high-frequency power source when $dV_r/dt-dV_f/dt$ increases over a first level, where V_f and V_r are a traveling-wave voltage and a reflected-wave voltage applied from the power meter, respectively; and a second cutting-pulse output unit which outputs the cutting pulse again for time T_1 to the high-frequency power source when V_r/V_f increases over a second level within a preset time T_0 after the first cutting-pulse

Applicant: Noboru Kuriyama
Application No.: 10/802,591

output unit outputs a cutting-pulse, and outputs the cutting pulse again for time $T1$ to the high-frequency power source when V_r/V_f increases over a second level within a preset time T_o during which the supply of power is re-started after outputting the cutting pulse to the high-frequency power source during the time $T1$.

17. (Withdrawn) A high-frequency arc-discharge control apparatus comprising: a glow-discharge apparatus which receives power from a high-frequency power source through a power meter and an impedance-matching circuit; a first cutting-pulse output unit which outputs a cutting pulse for time $T1$ to the high-frequency power source when $dV_r/dt-dV_f/dt$ increases over a first level, where V_f and V_r are a traveling-wave voltage and a reflected-wave voltage applied from the power meter, respectively; and a second cutting-pulse output unit which outputs the cutting pulse again for time $T1$ to the high-frequency power source when V_r/V_f increases over a second level and V_f becomes greater than $V_{fmax} \times 0.05$ within a preset time T_o after the first cutting-pulse output unit outputs a cutting pulse.

18. (Withdrawn) A high-frequency arc-discharge control apparatus comprising: a glow-discharge apparatus which receives power from a high-frequency power source through a power meter and an impedance-matching circuit; a first cutting-pulse

output unit which outputs a cutting pulse for time $T1$ to the high-frequency power source when $dV_r/dt - dV_f/dt$ increases over a first level, where V_f and V_r are a traveling-wave voltage and a reflected-wave voltage applied from the power meter, respectively; and a second cutting-pulse output unit which outputs the cutting pulse again for time $T1$ to the high-frequency power source when V_r/V_f increases over a second level and V_f becomes greater than $V_{fmax} \times 0.05$ within a preset time T_o after the first cutting-pulse output unit outputs a cutting-pulse, and outputs the cutting pulse again for time $T1$ to the high-frequency power source when V_r/V_f increases over a second level and V_f becomes greater than $V_{fmax} \times 0.05$ within a preset time T_o after outputting the cutting pulse to the high-frequency power source.

19. (Currently Amended) The high-frequency arc-discharge control apparatus according to any one of claims 15 [[to 18]] or 16, wherein the first level ranges from $V_{fmax} \times 0.05$ to $V_{fmax} \times 0.2$, the second level ranges from 0.5 to 0.95.

20. (Currently Amended) The high-frequency arc-discharge control apparatus according to any one of claims 15 [[to 18]] or 16, wherein the second cutting-pulse

output unit determines that the arc discharge has developed, when V_r/V_f remains at the second level or a higher level for time T_2 or longer.

21. (Original) The high-frequency arc-discharge control apparatus according to claim 20, wherein the first level ranges from $V_{fmax} \times 0.05$ to $V_{fmax} \times 0.2$, and the second level ranges from 0.5 to 0.95.

22. (Currently Amended) The high-frequency arc-discharge control apparatus according to claims 15 [[to 18]] or 16, wherein the preset time T_0 is measured, starting at a trailing edge of the cutting pulse.

23. (Original) The high-frequency arc-discharge control apparatus according to claim 20, wherein the preset time T_0 is measured, starting at a trailing edge of the cutting pulse.

24. (Withdrawn) A high-frequency arc-discharge control apparatus comprising: a glow-discharge apparatus which receives power from a high-frequency power source through a power meter and an impedance-matching circuit; a matching-storing unit which stores data representing that a load undergoes impedance matching, when

V_r/V_f is at a third level or a lower level, where V_f and V_r are a traveling-wave voltage and a reflected-wave voltage applied from the power meter, respectively; and a cutting-pulse output unit which outputs a cutting pulse to the high-frequency power source when V_r/V_f increases to a second level or a higher level while the matching-storing unit is storing the data representing that the load undergoes impedance matching.

25. (Withdrawn) A high-frequency arc-discharge control apparatus comprising: a glow-discharge apparatus which receives power from a high-frequency power source through a power meter and an impedance-matching circuit; a matching-storing unit which stores data representing that a load undergoes impedance matching, when V_r/V_f is at a third level or a lower level, where V_f and V_r are a traveling-wave voltage and a reflected-wave voltage applied from the power meter, respectively; and a cutting-pulse output unit which outputs a cutting pulse to the high-frequency power source when V_r/V_f increases to a second level or a higher level while the matching-storing unit is storing the data representing that the load undergoes impedance matching, and outputs the cutting-pulse again for time T_1 to the high-frequency power source when V_r/V_f increases to the second level or a higher level

within a preset time T_o after the cutting pulse is output to the high-frequency power source.

26. (Withdrawn) A high-frequency arc-discharge control apparatus comprising: a glow-discharge apparatus which receives power from a high-frequency power source through a power meter and an impedance-matching circuit; a matching-storing unit which stores data representing that a load undergoes impedance matching, when V_r/V_f is at a third level or a lower level, where V_f and V_r are a traveling-wave voltage and a reflected-wave voltage applied from the power meter, respectively; and a cutting-pulse output unit which outputs a cutting pulse to the high-frequency power source when V_r/V_f increases to a second level or a higher level and V_f becomes greater than $V_{fmax} \times 0.05$ while the matching-storing unit is storing the data representing that the load undergoes impedance matching.

27. (Withdrawn) A high-frequency arc-discharge control apparatus comprising: a glow-discharge apparatus which receives power from a high-frequency power source through a power meter and an impedance-matching circuit; a matching-storing unit which stores data representing that a load undergoes impedance matching, when V_r/V_f is at a third level or a lower level, where V_f and V_r are a traveling-wave

voltage and a reflected-wave voltage applied from the power meter, respectively; and a cutting-pulse output unit which outputs a cutting pulse to the high-frequency power source when V_r/V_f increases to a second level or a higher level and V_f becomes greater than $V_{fmax} \times 0.05$ while the matching-storing unit is storing the data representing that the load undergoes impedance matching, and outputs the cutting-pulse again for time T_1 to the high-frequency power source when V_r/V_f increases to the second level or a higher level within a preset time T_0 after the cutting pulse is output to the high-frequency power source.

28. (Withdrawn) The high-frequency arc-discharge control apparatus according to any one of claims 24 to 27, wherein the second level ranges from 0.5 to 0.95, and the third level ranges from 0.05 to 0.5.
